May 04, 2026

Replit is fundamentally changing the barrier to entry for software creation, shifting the focus from syntax to intent. The mission of "Autonomy for All" is a compelling challenge, and I am eager to apply my quantitative background to help Replit scale this vision by turning complex user behavior into a precise product roadmap.

The job description emphasizes the need for a data scientist who treats experimentation as a craft and avoids the pitfalls of novelty effects. With an MS in Quantitative Economics, my foundation is built on advanced econometrics and rigorous statistical methodology. I am trained to look past top-line numbers to identify the confound and pressure-test hypotheses before they reach a dashboard. Whether utilizing R for deep statistical analysis or Python for scalable data pipelines, my goal is to ensure that a feature launch is driving sustainable retention rather than a temporary spike in engagement.

I already integrate Generative AI tools into my workflow to accelerate the drafting and exploration phases of my analysis, which aligns with Replit's culture of using AI to multiply output. Combining this speed with my experience in Tableau for visualization, I am well-equipped to model the "aha moments" for new users and build the analytical foundation for Replit's enterprise expansion. I am particularly interested in identifying the specific collaboration dynamics and workspace patterns that signal a team's transition from trial to long-term adoption.

Being based in the Bay Area, I am excited about the prospect of collaborating in person at the Foster City office. I look forward to discussing how my quantitative toolkit and obsession with data integrity can help Replit achieve its growth and autonomy goals.

Sincerely,

Matthew Cromaz
